

Ruan Grobler

Automation Engineer, Microsoft Power Platform and Dataverse

Cape Town, South Africa | ruan@receva.co.za | portfolio.receva.co.za

PROFESSIONAL SUMMARY

I automate business processes on the Microsoft stack and prove what each one saved. **Five automation systems live in my first month** at a property services group, every one with failure alerting and a written runbook. I verify with code, not by eye: my latest Dataverse solution ships with thirty automated checks that query the running environment.

EXPERIENCE

Automation Engineer, TrueProp Property Services (True Group)

July 2026 to present, Western Cape

- **Five systems live in month one:** three built, two inherited and hardened
- **Recovered five orphaned production systems** from a departed developer, including HR compliance workflows down for over a month
- **AI email intake:** free text in, numbered tickets out, with requester, department and priority extracted automatically
- **Broker deal intake:** deals captured to SharePoint, attachments filed, duplicates blocked. **Migrated 200 of 200 historic deals, zero errors**
- **Own DEV, TEST and PROD:** build-in-DEV run-in-PROD standard, no flow depends on one person's account
- **Closed a POPIA gap** on a live lease application: consent capture with a hard gate before the affordability step
- **QR bulk ordering platform in three days**, ranked top priority by management (built, in business walkthrough)
- **Replaced a macro-Excel HR onboarding process:** 45-task workflow, cross-employee dashboard, automated task and probation emails (built, in business demo)

Founder, Receva

2026 to present

- **AI voice receptionist** for SME hospitality and healthcare on Retell AI, n8n and Twilio, live on a test line
- Own the full stack: call flows, webhooks, booking capture, follow-up automation

SELECTED BUILDS

Public code and openable proof at portfolio.receva.co.za

- **DealFlow CRM (Dataverse):** full solution provisioned through the Web API, not the maker portal. 4 tables, relationships with cascade behaviour, alternate keys, security roles, column security, charts, a dashboard, a cloud flow and a published model-driven app. **Thirty automated checks against the running environment**
- **DealFlow SQL:** PostgreSQL warehouse, **1.16 million rows**, star schema with SCD Type 2, 85 partitions. Rebuilds in one command. Public repo
- **Agent Pipeline:** multi-agent document triage on LangGraph. **267 tests. Live run: 26 of 26 routing decisions correct**
- **ApplyForge:** AI job-matching engine on the Claude API with structured outputs and a content guard that blocks unverified claims. Gated by Vitest and GitHub Actions
- **HR Onboarding System:** Node.js, Express and SQLite web app replacing two macro-enabled workbooks, with test mode for safe email runs
- **Claude Code rig:** custom subagents, MCP servers, hooks and scheduled agents running builds unattended

SKILLS

Power Platform Power Automate (approvals, error handling, premium connectors), Dataverse (data modelling, relationships, alternate keys, security roles, column security, FetchXML, Web API provisioning), model-driven apps, SharePoint Online, AI Builder (GPT prompts, OCR), Microsoft Forms, environment and solution management

AI engineering Claude API with structured outputs, LangGraph multi-agent orchestration, MCP servers, Retell voice agents, prompt engineering

Development and data TypeScript, Next.js, Node.js, Express, Python, SQL, PostgreSQL, SQLite, Docker, REST APIs, JSON, webhooks, n8n, Git, GitHub Actions

Testing and delivery Vitest, pytest, CI/CD pipelines, data quality assertions, spec-first builds, runbooks

HOW I BUILD

- **Verification is code, not opinion.** Every build ships with checks that query the running system and fail loudly
- **Repeatable over clicked.** Environments rebuild from scripts, not from memory. I documented **13 platform failure modes** and their fixes during the Dataverse build
- **I correct my own spec.** When research disproved a design decision I had defended, I changed it and wrote down why it was wrong

CERTIFICATIONS

Microsoft PL-900 Power Platform Fundamentals, exam scheduled. Documented path to PL-400 Power Platform Developer.

Self-taught across the Microsoft Power Platform, Python, TypeScript and SQL, with the shipped systems above as the evidence.

References and written stakeholder confirmation of delivered systems available on request.
